Configuration lame d'air en incidence

Physique Tout-en-un PC/PC*, Dunod, 2016 p807

Anneaux d'égale inclinaison Anneaux d'Haidinger

En incidence normale, on a : $\delta = 2e$.

$$I(e) = 2I_0 \left(1 + \frac{1}{2} \cos \left(\frac{4\pi e}{\lambda_1} \right) + \frac{1}{2} \cos \left(\frac{4\pi e}{\lambda_2} \right) \right)$$

$$\Leftrightarrow I(e) = 2I_0 \left(1 + \cos \left(2\pi e \left(\frac{1}{\lambda_1} + \frac{1}{\lambda_2} \right) \right) \cos \left(2\pi e \left(\frac{1}{\lambda_1} - \frac{1}{\lambda_2} \right) \right) \right)$$

On pose $\bar{\lambda}$ et $\Delta\lambda$ tels que :

$$\frac{1}{\overline{\lambda}} = \frac{1}{2} \left(\frac{1}{\lambda_1} + \frac{1}{\lambda_2} \right)$$

$$\frac{1}{\lambda_1} - \frac{1}{\lambda_2} = \frac{\lambda_2 - \lambda_1}{\lambda_1 \lambda_2} = \frac{\Delta \lambda}{\lambda_1 \lambda_2}$$

Donc:

$$I(e) = 2I_0 \left(1 + \frac{4\pi e}{\bar{\lambda}}\right) \cos\left(2\pi e \frac{\Delta \lambda}{\lambda_1 \lambda_2}\right)$$
Terme d'interférences Contraste $C(e)$

$$C(e) = 0 \Leftrightarrow 2\pi e \frac{\Delta \lambda}{\lambda_1 \lambda_2} = \frac{\pi}{2} + k\pi, k \in \mathbb{Z}$$

L'annulation du contraste est obtenue pour :

$$e_k = \frac{\lambda_1 \lambda_2}{4\Delta \lambda} \pm k \frac{\lambda_1 \lambda_2}{2\Delta \lambda}$$

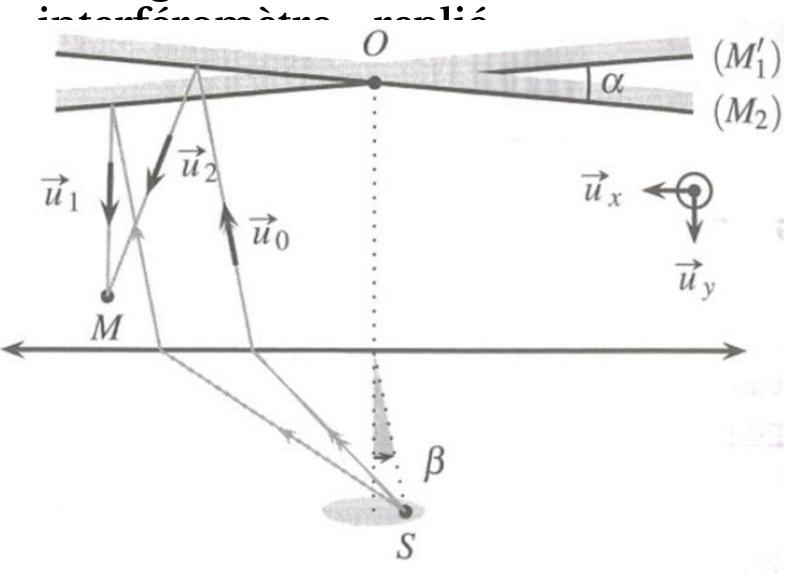

Entre deux annulations :

$$\Delta e = e_{k+1} - e_k = \frac{\lambda_1 \lambda_2}{2\Delta \lambda}$$

Théoriquement, pour le doublet du sodium :

$$\lambda_1=589,0$$
 nm et $\lambda_2=589,6$ nm.
Donc $\Delta e=0,29$ mm
